

# AI ASSISTED CODING

---

## LAB ASSIGNMENT -10.2

---

Program : B-TECH  
Specialization : AIML  
Name of Student : AKULA MANOJ  
Enrollment-No : 2403A52031  
Batch No : 02  
Date : 07-10-2025

---

### TASK DESCRIPTION:1

AI-Assisted Code Review (Basic Errors)

- Write a Python program as shown below.
- Use an AI assistant to review and suggest corrections

**PROMPT:-** CORRECT THE MISTAKES IN THE FOLLOWING CODE.

**GIVEN CODE:-**

```
def calcFact(n):  
    result=1  
    x=0  
    for i in range(1,n):  
        result=result*i  
    return result  
  
def main():  
    num = 5  
    FACT = calcFact(num)  
    print("the factorial of",num,"is",FACT)  
    t=10  
    if FACT>10:  
        print("BIG Number")  
    else:  
        print("small number")  
  
main()
```

## -OBSERVATION ON GIVEN CODE:-

I found the simple mistakes, like the code is not running properly in the interpreter.

I found in mistake that it is using calcFact(num), using calFact is wrong.

Mainly Function is not properly written.

## -GENERATED CODE BY AI WITH OUTPUT:-

```
def calculator(n):
    """Calculates the factorial of a non-negative integer n."""
    result = 1
    # The factorial of 0 is 1
    if n == 0:
        return 1
    # Calculate factorial for n > 0
    for i in range(1, n + 1):
        result = result * i
    return result

def main():
    # Set the number for which to calculate the factorial
    num = 5
    # Call the calculator function to get the factorial
    FACT = calculator(num)
    # Print the result
    print("the factorial of", num, "is", FACT)

    # Check if the factorial is a "BIG Number" or a "small number"
    if FACT > 10:
        print("BIG Number")
    else:
        print("small number")

    # Execute the main function
    main()
```

the factorial of 5 is 120  
BIG Number

## -OBSERVATION ON CORRECTED CODE:-

As expected, the code was corrected by using the correct calculator Function.

## OVERALL OBSERVATION:

I found that it is throwing errors in the given code, and AI perfectly found the error and corrected it by generating a fresh new code with the correct Output.

## **TASK DESCRIPTION:2**

Automatic Inline Comments.

- Write the Python code for Fibonacci as shown below and execute.
- Ask AI to improve variable names, add comments, and apply PEP8 formatting (cleaned up).
- Students evaluate which suggestions improve readability most. one.

Expected Output#2: Clean format Python code with much readability.

**GIVEN CODE:-**

```

def f1(xX):
    a=0
    b=1
    c=2
    Zz=[a,b]
    while c<=xX:
        d=a+b
        Zz.append(d)
        a=b
        b=d
        c=c+1
    return Zz

def m():
    NN=10
    ans=f1(NN)
    print("fib series till",NN,":",ans)

m()

```

**PROMPT:-**correct the given code and use proper comments.

**CORRECTED CODE WITH OUTPUT:-**

```

def generate_fibonacci_series(limit):
    """
    Generates a Fibonacci series up to a specified limit.

    Args:
        limit: The upper limit for the Fibonacci series.

    Returns:
        A list containing the Fibonacci series up to the limit.
    """
    # Initialize the first two Fibonacci numbers
    fib_series = [0, 1]
    # Start with the third number
    next_fib = 2

    # Generate the series until the limit is reached
    while next_fib <= limit:
        # Calculate the next Fibonacci number
        next_number = fib_series[-1] + fib_series[-2]
        # Append the next number to the series
        fib_series.append(next_number)
        # Move to the next number in the series
        next_fib = next_fib + 1

    return fib_series

def main():
    # Set the limit for the Fibonacci series
    number_limit = 10
    # Generate the Fibonacci series
    fibonacci_result = generate_fibonacci_series(number_limit)
    # Print the result
    print("Fibonacci series up to", number_limit, ":", fibonacci_result)

# Execute the main function
main()

```

Fibonacci series up to 10 : [0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55]

**OBSERVATION:** The **given code** is incomplete, and the names are not given properly, which leads to wrong output. And the **AI corrected** and completed the full code with comments to get proper output.

### TASK DESCRIPTION:3

- Write a Python script with 3–4 functions (e.g., calculator: add, subtract, multiply, divide).
- Incorporate manual docstring in code with NumPy Style
- Use AI assistance to generate a module-level docstring + individual function docstrings.
- Compare the AI-generated docstring with your manually written one

### CODE:

```
def add(x, y):  
    """ Adds two numbers and returns the result."""  
    return x + y  
  
def subtract(x, y):
```

```
        """Subtracts the second number from the first and returns the
        result."""
```

```
    return x - y
```

```
def multiply(x, y):
```

```
    """Multiplies two numbers and returns the result."""
```

```
    return x * y
```

```
def divide(x, y):
```

```
    """Divides the first number by the second and returns the result.
```

```
    Handles division by zero by returning an error message."""
```

```
    if y == 0:
```

```
        return "Error: Division by zero!"
```

```
    return x / y
```

```
# Example usage:
```

```
num1 = 10
```

```
num2 = 5
```

```
print(f"{num1} + {num2} = {add(num1, num2)}")
```

```
print(f"{num1} - {num2} = {subtract(num1, num2)}")
```

```
print(f"{num1} * {num2} = {multiply(num1, num2)}")
```

```
print(f"{num1} / {num2} = {divide(num1, num2)}")
```

```
print(f"{num1} / 0 = {divide(num1, 0)}")
```

**OUTPUT:**

$$10 + 5 = 15$$

$$10 - 5 = 5$$

$$10 * 5 = 50$$

$$10 / 5 = 2.0$$

$$10 / 0 = \text{Error: Division by zero!}$$

## MANUAL CODE WITH DOCSTRINGS:-

```
def add(x, y):
```

```
    """
```

```
    Adds two numbers.
```

```
    x: float or int
```

```
        The first number.
```

```
    y: float or int
```

```
        The second number.
```

```
    float or int
```

```
        The sum of the two numbers.
```

```
    """
```

```
    return x + y
```

```
def subtract(x, y):
```

```
"""
```

Subtracts the second number from the first.

x : float or int

The first number.

y : float or int

The second number.

float or int

The difference between the two numbers.

```
"""
```

```
return x - y
```

```
def multiply(x, y):
```

```
    """
```

Multiplies two numbers.

x : float or int

The first number.

y : float or int

The second number.

Returns

```
-----
```

float or int

The product of the two numbers.

"""

return x \* y

def divide(x, y):

"""

Divides the first number by the second.

x : float or int

The numerator.

y : float or int

The denominator.

float or int or str

The quotient of the two numbers, or an error message if division by zero.

"""

if y == 0:

return "Error: Division by zero!"

return x / y

# Example usage:

```
num1 = 10
```

```
num2 = 5
```

```
print(f"{num1} + {num2} = {add(num1, num2)}")
```

```
print(f"{num1} - {num2} = {subtract(num1, num2)}")
```

```
print(f"{num1} * {num2} = {multiply(num1, num2)}")
```

```
print(f"{num1} / {num2} = {divide(num1, num2)}")
```

```
print(f"{num1} / 0 = {divide(num1, 0)}")
```

**AI to generate a module-level docstring + individual function docstrings:-**

```
"""
This module provides basic arithmetic operations: addition, subtraction,
multiplication, and division.
"""
```

```
def add(x, y):
```

```
    """
```

```
    Adds two numbers.
```

```
    Parameters
```

```
    -----
```

```
    x : float or int
```

```
        The first number.
```

```
    y : float or int
```

```
        The second number.
```

```
    Returns
```

```
    -----
```

```
    float or int
```

```
        The sum of the two numbers.
```

```
    """
```

```
    return x + y
```

```
def subtract(x, y):
```

```
    """
```

```
    Subtracts the second number from the first.
```

```
    Parameters
```

```
    -----
```

```
    x : float or int
```

```
        The first number.
```

```
    y : float or int
```

```
        The second number.
```

```
    Returns
```

```
    -----
```

```
    float or int
```

```
        The difference between the two numbers.
```

```
    """
```

```
    return x - y
```

```
def multiply(x, y):
```

```
    """
```

```
    Multiplies two numbers.
```

```
    Parameters
```

```
    -----
```

```
    x : float or int
```

```
        The first number.
```

```
    y : float or int
```

```
        The second number.
```

```
    Returns
```

```
    -----
```

```
    float or int
```

```
        The product of the two numbers.
```

```
    """
```

```
    return x * y
```

```
def divide(x, y):
```

```
    """
```

```
    Divides the first number by the second.
```

```
    Parameters
```

```
    -----
```

```
    x : float or int
```

```
        The numerator.
```

```
    y : float or int
```

```
        The denominator.
```

```
    Returns
```

```
    -----
```

```
    float or int or str
```

```
        The quotient of the two numbers, or an error message if division by zero.
```

```
    """
```

```
Returns
-----
float or int or str
    The quotient of the two numbers, or an error message if division by zero.
"""
if y == 0:
    return "Error: Division by zero!"
return x / y

# Example usage:
num1 = 10
num2 = 5

print(f"{num1} + {num2} = {add(num1, num2)}")
print(f"{num1} - {num2} = {subtract(num1, num2)}")
print(f"{num1} * {num2} = {multiply(num1, num2)}")
print(f"{num1} / {num2} = {divide(num1, num2)}")
print(f"{num1} / 0 = {divide(num1, 0)}")
```

```
10 + 5 = 15
10 - 5 = 5
10 * 5 = 50
10 / 5 = 2.0
10 / 0 = Error: Division by zero!
```

## OBSERVATION:-

I found that the Doctstrings which is generated by AI with neat and clear.

Doctstrings is written in the type comments, not as detailed written there compared to the AI-generated Docstring.

# THANK YOU
